説明			
<p>This is a patch set to give the administrator/manager the option exclude projects from being automatically created when using the reposman.rb script.</p> <p>To apply the patch, run the following command from inside your redmine directory: <code>patch -p0 < /path/to/redmine-autocreate-repository.patch</code></p> <p>One of the implications is that you can allow a subproject to use a folder in the parent project's repository, instead of creating completely separate repositories every time.</p> <p>Hopefully, this patch will be useful.</p>			
<p>journals</p> <p>Shoot... There was a couple of errors in that patch. The following patch works</p> <p>advertised.</p> <p>I see that in the transfer from rubyforge.org to redmine.org, the order of the patches were messed up. The correct patch is the largest one, i.e.:</p> <p>http://www.redmine.org/attachments/download/132</p>
