**説明**

Actually, you need to know de request identifier to set a link.

journals

bump.

This would be nice to have.... when linking related items being able to double-click on the issue # column and have a scrolling list of the issues in the system would be nice.

AJAX maybe? show a half-dozen ID#s where the ordinal issue # is close to the one being edited. As you scroll up/down the list is pulls the next grouping. Click on the issue would store the issue # in the "related to" entry box.

Remembering IDs, or opening another copy of Redmine in another window is cumbersome... especially for old senile people like me. :)

Even more useful would perhaps be to be able to see some history (last 5 visited issues with a truncated subject). I do usually want to link to some issue i just visited.

/T
