説明			
Allows to define "prototypes" along with an URL prefix, so it will be easy in markup to reference external resource without needing a copy/paste of a full URL			
Example with proto='mywiki' ; URL prefix=" http://wiki.company.com/display/space/ " :			
markup : "Check This":mywiki:somewikipage formatted into Check This			
Other examples :			
"Great language":wp:Ruby_(Programing_Language) Great language			
:wp:Redmine Redmine			
note: also same feature asked for CustomFields			
journals			
see also #2083			
For info : I've currently hardcoded such feature by adding a method in wiki_formatting.rb, but it's not very pretty ...			
<pre> #-- Erwan Ducroquet 2008-10-23 generate links depending on proto def inline_specific_link_do(all, start, proto, url, title) case proto when 'stp' "#{start}#{title}" when 'ccl' "#{start}#{title}" when 'wp' "#{start}#{title}" when 'google' "#{start}#{title}" when 'file' "#{start}#{title}" else all end end </pre>			

```
#-- Erwan Ducroquet 2008-10-23 add own way to handle specific URL prototypes : STP wiki links, files, ClearCase, ext Reviews
#-- format is :repository:resource or "title":repository:resource
def inline_specific_link(text)
  text.gsub!(/^(["/n]+)" :([a-z]+) !(:[ /w _ // // !: /- /+ /( /)]+)) do
    inline_specific_link_do( $&, ", $2, $3, $1)
  end
  text.gsub!(/ :([a-z]+) !(:[ /w _ // // !: /- /+ /( /)]+)) do
    inline_specific_link_do( $&, ", $1, $2, $2)
  end
end
```
