 bl:Serdecznie Pozdrawiam n common case you're right. Try imagine situation when three times in week you have task that affected 4 subprojects. For example (in real world it's in big scale): Main task: "Additional informations in the client data", this task affected subprojects: subproject 1, (common: large database DDL) - new fields, tables, something subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations 	This makes little sense	e, unless ticket was too vague.			
n common case you're right. Try imagine situation when three times in week you have task that affected 4 subprojects. For example (in real world it's in big scale): Main task: "Additional informations in the client data", this task affected subprojects: • subproject 1, (common: large database DDL) - new fields, tables, something • subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations	Kind regards				
 Try imagine situation when three times in week you have task that affected 4 subprojects. For example (in real world it's in big scale): Main task: "Additional informations in the client data", this task affected subprojects: subproject 1, (common: large database DDL) - new fields, tables, something subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations 	pl:Serdecznie Pozdrawiam				
 or example (in real world it's in big scale): Main task: "Additional informations in the client data", this task affected subprojects: subproject 1, (common: large database DDL) - new fields, tables, something subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations 	In common case you'r	e right.			
 subproject 1, (common: large database DDL) - new fields, tables, something subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations 	Try imagine situation	when three times in week you have task the	at affected 4 subpr	rojects.	
 subproject 2, (staff/workers: backend, rails) - create new form to manage additional informations 	For example (in real w	vorld it's in big scale): Main task: "Additiona	informations in th	ne client data", this task affected subprojects:	
	 subproject 2, (st 	aff/workers: backend, rails) - create new for	m to manage addi	tional informations	

• subproject 4, (common, some live business logic, JAVA) - make boo boo on that informations ;-p

Of course, when we have that situation from time to time or/and task is enough large to split into 4 smaller task then all works fine but when task is small and situations occurs many times we must for example create 5 tickets (about 30 min work time) for job that 2-3 peoples make in 2 hours :-)

pl: pozdrawiam równie , redmine jest wietny (ale ssie troszk przy podprojektach).

This is not ideology problem, it's time waste/task management problem in daily use.

Then maybe a quick and easy way to create secondary related blocking issues ??

So someone creates a big Issue on main project. and then with a single button creates sub issues in sub projects.

Each sub issue is flagged as an issue blocking the main project issue. ?

Zarooba Rozruba wrote:

Then maybe a quick and easy way to create secondary related blocking issues ??

So someone creates a big Issue on main project. and then with a single button creates sub issues in sub projects.

Each sub issue is flagged as an issue blocking the main project issue. ?

Yes, this is quite good solution but save some time every week :-).

One click, might add one related ticked in subproject (AJAX of course).

+1000 for that :-)

Just noticed a related issue #443 . See if this helps.

Pozdrawiam

+1. Given that now sub tasks exists - and they can be part of sub projects, I think essential thing here is that we should have a quick access UI which "create a copy as a sub ticket" and assign it to respective sub-project right away.

Actually the bigger challenge (and that might be useful) is that some specific fields of the main ticket controls the respective field of the sub-ticket. For example, if the customer info changes in the main ticket - the same should be reflected in this "sub-ticket". Currently, only such "controlled" fields are Start-Date Due-dates which are actually linked and cannot be changed arbitrarily. What you really want is that a set of fields, (and may be issue statuses) should also be changed once, say in main ticket and reflected everywhere.
