gems.github.com is almost gone.

Simply (config/environments/test*.rb):

config.gem "shoulda", :source => "http://gemcutter.org"

journals

Agreed but the Github gems will be around until October 2010 (according to their reports). We will also need to move over Object Daddy, which I'll probably have to fork and build myself.

Why not embed Object Daddy as a plugin, which seems to be the official way to do it?

It would add to the size of the download for Redmine (svn and archives) even if the user won't be running the tests. I've already "forked":http://github.com/edavis10/object_daddy "object_daddy":http://gemcutter.org/gems/edavis10-object_daddy and added some bug fixes that the official repository is missing.

I've switched to the @shoulda@ gem in r3403.
