説明
A relatively new, but useful feature of git are "git notes":<http://www.kernel.org/pub/software/scm/git/docs/git-notes.html>. Redmine currently does not handle notes correctly. GitHub recently rolled out with "support":
<http://github.com/schacon/kidgloves/commit/0385bcc3bc66d1b1ec07346c237061574335c3b8> of notes. Perhaps redmine could do something similar.

I like this feature, at least to add support display notes online as first step,

Would be great to have commit-to-ticket relations under a given notes-ref.

For example:
@git notes --ref=redmine add -m "see #18271"@

The related commit should be displayed (like already done by commits containing such a relation directly) on the ticket's details page.

This would separate the actual commit message (what have been done) and the relation to redmine tickets into a separate namespace.

Imho this is cleaner than having the relation in the commit message itself.

+1. too many times committers fofget IssueId # tagging. Notes could be a good way to handle this at the repository side.
