Wiki redirects need to be editable:

- Unredirect a page (and change back links to that page)
- Redirect to an existing page (e.g. for synonyms)

Currently, if there is page A and it's renamed to page B with "Redirect existing links" selected, a new page A cannot be created.

I think it would be better if redirects are defined in a page's content (similar to how it works on Wikipedia). That way many different pages can redirect to one target page, and if a redirecting page later needs to hold content, it can be easily edited.

FYI, a workaround without going to the database:

SCENARIO:

Originally named page "Page A"

Later renamed page "Page B" with the "redirects" option checked.

Later, we want to create a separate page for "Page A"

WORKAROUND:

Rename "Page B" to "Page A" with the "redirects" option checked.

Rename "Page A" to "Page B" with the "redirects" option NOT checked.

Great information, appreciated very much!

+1 for this feature

+1!

That workaround still works on Redmine 1.4.4. Thanks!

That workaround still works on Redmine 2.4.2.stable. Many Thanks!

+1

For the curious with database access the example below queries and lists existing redirects:

```
$ mysql -u redmine_default -p redmine_default -e "select * from wiki_redirects;"
Enter password:
+----+---------+-----------------------------------------+----------------+-------------------+
| id | wiki_id | title                                   |                | redirects_to
+----+---------+-----------------------------------------+----------------+-------------------+
|  1 |     113 | Wiki                                    |                | Learning_JavaScript_MVC_and_An
      113 |
...
+----+---------+-----------------------------------------+----------------+-------------------+
```

Beware if changing anything that it will probably also affect the relationship between data in the tables wiki_contents, wiki_pages and wiki_redirects.
