**説明**

The current JavaScript that Redmine uses in production environment is not minified using a tool such as Google Closure or YUI Compressor. This will dramatically reduce the size of the page a client has to download if it was used.

journals

This would be nice to add but we would need to make sure to track unminified versions in svn/git.

Sure, what I do is have a \*.src.js and \*.js of my files. When running in a development mode the application simply uses the \*.src.js version instead.
