The comment redmine automatically closes the issue with will say something like 'Applied in changeset r_4.' instead of the actual changeset number.

journals

You mean there's a "_" in the message that shouldn't be here ? And can you test if it's still the case in 1.0.x versions ?

Sorry, I should of clarified that -- no. Our actual revision numbers are in the thousands, but the numbers in the update message are always small. It looks like they are maybe temporary revisions used to group the CVS file changes into one changeset. I've also noticed that if I refresh the activity page while redmine is polling the respository the same 'changeset r_4' messages will appear. If I refresh after it is done they end up as real changeset numbers e.g. r9779.

I can't easily check the 1.0.x versions without upgrading our server.

I confirmed svn trunk has this problem.

I attach an image.

The reason is following.

cvs adapter creates changeset with temporary revison "_X" at source:tags/1.0.3/app/models/repository/cvs.rb#L121

Changeset.after_create() is called and new journal is added at source:tags/1.0.3/app/models/changeset.rb#L76

cvs adapter changes revisons "_X" to "Y" at source:tags/1.0.3/app/models/repository/cvs.rb#L148

To fix this issue, I generate pseudo scmid "branch_name-YYYYMMDD-HHMMSS".
Redmine generates pseudo revision number, and using this number for auto close issue text is very difficult.
Redmine supports scmid of Git, Mercurial, Bazaar and Darcs.
Redmine supports "commit:scmid" in wiki. You can use first some letters of scmid.

For example, "commit:branch_name-YYYYMMDD-HHMM".
