**説明**

It would be useful to be able to query additional information about journal entries over the REST API. At the moment I am trying to find the best way of retrieving the date on which a particular journal-entry was created. This could be done in one of two ways:

- Create a separate 'journals' read-only/GET-only REST method that allows you to query for specific journal ID's and returns info from the `journals` database-table. E.g:

```
GET /journals/[id].xml
```

- Alternatively, the journals object returned in the issues.xml could be enriched to contain the additional information from that table, such as the `created_on` date.

journals

The `created_on` was clearly missing and was added in r4512. This seems to be the only attribute that was missing so I think we can close this ticket. Reopen if I am missing something.
