<b>説明</b>			
<p>With new gantt charts, subprojects for which parent project doesn't have issue_tracking enabled are not shown.</p> <p>Explicit use case: I defined some root projects where I only enable gantt, calendar and news systems, and subprojects which map to real-world projects so they have issues, versions, documents, etc.</p> <p>I have a working patch for that, but it's pretty inefficient:</p> <ul style="list-style-type: none"> <li>• either you display all projects (not desired behaviour I suppose?)</li> <li>• either you try to find if a project have descendants with issue_tracking enabled (respecting visibility...)</li> </ul> <p>I'd welcome any suggestion to define what should be the desired behaviour and what are the potential extreme cases we don't want to handle.</p>			
journals			
<p>Good catch! I'd vote +1 for your second solution, though it shouldn't introduce (more?) performance issues within such an implementation.</p> <p>The attached patch should fix it with option 2.</p> <p>Still hard to use on a large project base : 100+ projects =&gt; "Completed in 24617ms", VS 1.6s for the test database. I had nearly the same results with my patch but it was less clean (I imagine parsing @.descendants@ for each project costs a lot). I'll try to see if I can improve it.</p> <p>OK, nothing to do with searching for @.descendants@ in each project. I turned on development mode, I end up with some 922 queries to the database, maybe a <u>bit</u> too much ;) To be continued</p> <p>And I've already made a few optimizations on the initial implementation. It's still very slow and I think we'll have to make some compromises, like removing project/version completion calculation which generates a bunch of queries. Project completion is not calculated properly BTW.</p> <p>Fixed in r5077.</p>
