説明 I'm sending request: <pre>get all issues with projectKey=... and query id = ...</pre> one of these fields is invalid, and I don't know which one (it's some parameter provided by user). or maybe they are both invalid. the server responds "404 not found", which is expected. now, how can I understand which parameter was not recognized exactly - projectKey or queryID? is it possible to provide some kind of XML response in addition to 404 in this case?
