Please, see screenshots in attachment.

BTW, good to see you back =)

Ok, got it. We can be careful about the selector: maybe a `@div.wiki > p { word-wrap:break-word; }@` is not too risky and would be good enough in most cases.

Actually, both the issues were related to formatting text in issue description, not in wiki.

It may be useful to add this thing in wiki (at least more than in issue description), I don't know if this behavior is also present in wiki ?

Yes actually, div's containing textilized text in issue page have the "wiki" class, I know it's a bit confusing ;)

Yes, this behavior is also presents in wiki.

a "fix" that is not really useful

we break something in the page layout in some cases

I want to fix it in my local redmine installation at least. And I want to do it as accurately as it possible. Could you cite an instance of such breaking, please?
