説明

Patch is intended to reduce the need for multiple issues requests and provide granular issue tree lookups (parent_id / root_id)

For example, instead of three requests:

```
/issues.xml?tracker_id=2
/issues.xml?tracker_id=6
/issues.xml?tracker_id=7
```

You can do:

```
/issues.xml?tracker_id=2|6|7
```

Changes

Query Model:

- Extends integer equality, converts array of values to 'IN' sql.

Issues Controller:

- Support 'id', 'root_id', 'parent_id' params.

journals

Is this patch going to become part of an official release of redmine?

I assume, with this patch, the following GET will work? <http://demo.redmine.org/issues.xml?id=2521|4456>

To be consistent with the rest of the API you might want to change the separator from "|" to ",". That's how the redmine API works for `@?include=journals,changesets@`

Related use case: <http://www.redmine.org/issues/10259>

Please consider to add the patch to a release.

+1

and would resolve #10763

+1

It resolves the Feature #6118 with the API

I'd argue this is slightly different and the vertical bar is correct here: it follows similar functionality to the existing API query for `Assignee`, which would be something like: `@issues.json?assigned_to_id=6|7@`

I'm not sure the attachment:restapi-issues-id-param.patch patch is quite appropriate though, it updates the main `@issues_controller.rb@` to add in the additional filter parameters whereas all other filtering is done in the `@issue_query.rb@`.

I'm not up to speed on ruby myself but I'll try to take a look and see if it can be implemented there in the same way as the `@assigned_to_id@` parameter does.

related_issues

relates,Closed,6118,Filter by parent task or subtasks

relates,Closed,10259,Allow getting a list of issues by ID through the API

relates,Closed,10763,REST-API: Please add "parent_issue_id" as filter for requests to filter out subtickets
