説明 The fixed height on the #header makes header break down into the header, when Titles are long. In our company they make a lot of long headers, which makes the header break into the main menu way too often and disturbs the UX. To fix this and keep the header flexible for single- and multiple lines, simply add (or change) the following CSS: <pre>#header { height:auto; } #header h1 { padding-bottom: 30px; }</pre> journals I've committed a different fix in r11351 to avoid the bottom-padding on the h1. Can you confirm it's OK? I tested with several projects (parent-child-child..) with long names. Some part was dropped because not fitted in the header. P.S. May header should have variable height? Ivan Cenov wrote: I tested with several projects (parent-child-child..) with long names. Some part was dropped because not fitted in the header. P.S. May header should have variable height? Did you apply the fix before your test ? Because the patch makes the height variable. Hmm, It seems I have forgotten to make svn update before test. The height is variable. .	
OK, thanks for the feedback.
