説明

+Brief Description:+

- Since update to V2.3.0, it's not possible to delete a related issue.
- this worked very well in former versions

+Reproduce Hints:+

open a Ticket view, go down to 'Related issues' and [Add] an issue

select 'Related to', type another valid ticket no. of same project and [Add] => everything ok!

Now try to [Delete Relation] of that issue in same view

Dialog 'Are you sure?', press [Ok] => relation is still active!

+Notes:+

- We tried a lot, but did not find a workaround for that bug.
- The bug exists in V2.3.1 too.
- 'Related Issues' is a powerful feature in Redmine. So we hope, that somebody improves the priority of this defect for next release V2.3.2.

journals

This seems to be a problem triggered by running redmine in a subpath. To make redmine run in the subpath "/redmine", two things were done:

The line @Redmine::Utils::relative_url_root = "/redmine"@ was added as last line of @config/environment.rb@

The workaround described "here":

<http://www.redmine.org/boards/2/topics/30676?r=30881#message-30881> was used.

This adds the prefix "/redmine" to all links, but it misses the "Remove relation" link. However, even after adding the prefix, redmine

can't route the DELETE-request: ActionController::RoutingError (No route matches [DELETE] "/redmine/relations/123456").

Hope this helps in fixing it.

This may be considered as resolved.

The problem was that routes to relations are shallow routes and the variable `@:shallow_path@` was not set accordingly. It would be nice if redmine would work in subdirectories again. Using a reverse proxy sadly is no option, because some paths are hardcoded into JS, which makes them hard to adjust.

I've posted an attempt of a solution "here":

<http://www.redmine.org/boards/2/topics/30676?r=37825#message-37825>, but that is probably not the best way of resolving the issue.

According to <http://stackoverflow.com/questions/6422677/rails-routes-with-scope-locale-and-shallow-nested-resources>, you should be able to specify `:shallow_path` only once with your scope (not tested):

```
scope :path => "redmine", :shallow_path => "redmine" do
  ...
end
```

IIRC, there was no need to change the routes with Rails 2 for running in a suburi.

While using `@:shallow => true@` ignores the scope, using a shallow block takes care of it. I'm not sure that it's an expected behaviour from Rails but I've committed the change in `r11851`. Wrapping the routes in a single scope now generates all routes with that scope properly.

Merged.
