説明

In ApplicationController#render_error, responding formats are HTML and REST API. It would helpful if render_error could respond with JS.

journals

What kind of response do you expect?

Recommend an errors.js view in common directory that adds the flash messages to the top of the page similar to a validation error when saving an object. Display the errors with content in that construction in HTML response.

Added in r12855. The error is displayed with a simple JS alert().
