<b>説明</b>			
<p>in my company we have 2 redmines. One for our customers and one for the development team.</p> <p>I'd like some issues from the "support" redmine to be automatically copied (or manually) to the "dev" redmine. Issue for customers appear "escalated".</p> <p>The ideal solution would be that when the issue in dev is completed, the issue in support has another status...</p> <p>journals</p> <p>Why not having both use cases in the same instance? Redmine now have a pretty complete access control mechanism to allow the isolation you want.</p> <p>I would like this feature too, but for a more complex cenario.</p> <p>the development center is 100% intern and running in our intranet for security purposes. whereas the support center is external.</p> <p>Furthermore, we don't use the same skin internally and for our customers.</p>
