説明 When editing a comment, inside an issue the "update time" should(?) change after editing a comment but it doesn't show an updated timelog. This occured after updating from redmine 2.0 to 2.5, maybe i missed something when migrating the database? I used the guide from the wiki and everything worked out fine without errors until now. Thanks journals the timestamp of "updated" comments also doesnt change in the timelog in the "view for all tickets". edited, does it change here? so it has been updated but the timelog doesnt change, weired.. maybe it's just the translation thats strange... edited: 17 minutes after creation: Shouldnt the "updated XY ago" timestamp change to "updated less than a minute ago?" I've checked the table structure, it doesn't have a timestamp for updates that are happening on the record, we could either add a new field just for that, or we could touch the creation time field, but it would be a little confusing. This can also be considered as a feature. Redmine shouldn't do anything, especially it should not send an email after correcting a spelling mistake for example. If something important happens, that should be described in a new note. On dokuwiki there is a checkbox with which an edit can be marked as "minor change". A similar feature can be used to mark edits which must not result in email sending or timestamp update. related_issues duplicates,Closed,26304,Updating the issue update text does not affect updated time information
