説明 Current process: • User logs in • Accesses its page • Opens the mobile app • Enters the instance's URL • Enters the API key The last two steps are to enter long strings manually, the last one is entirely a non-intuitively string. Proposed process: • User logs in • Accesses its page • Opens mobile app • Scans the QR Code (containing both the URL and API Key) The QR Code should be accessible after clicking "Show" just like it is now. I attached a screenshot of how I think it should be.
