説明

Currently the mail handler will try to parse anything that remotely resembles square brackets containing a hash followed by a number, whatever else happens to be in front of the hash in the brackets. This leads the mail handler to try to parse things like:

[12345678901234567890#1234]

and

[some-string#1234]

used by other systems.

The proposed patch Requires the hash to be either preceded by the opening bracket @[or a space.

journals

No problem merging that as long as it has some more tests for failing strings we introduce... and for good ones too, as I can't find tests in @test/unit/[mail_handler_test.rb](#). Maybe it's time to refactor the logic in @MailHandler#dispatch@ too. Felix: can you handle that ? Thanks!

Sure, can you assign it back to me so that I can remember it? Thanks :-)

Maybe it's time to refactor the logic in @MailHandler#dispatch@ too.

I'll see about that, but I guess it's out of scope for this ticket.

Here we go!

Jean-Baptiste, there's already tests for good strings of sorts with the test that try to import emails and make sure they've been imported correctly. I fear the best I can do would be to provide 1 or 2 examples of incoming emails that should fail, or even with bad and good

strings pointing to different issues.

Here's a patch with 2 test-emails containing subjects with strings we don't want to match anymore pointing to the wrong issue and strings we want to match pointing to the right one.

Is this planned to be included in a release soon? I think this would make the email integration with OTRS much simpler!

Fix committed in r13593 with tests edited, thanks.

Merged.
