説明 Hi, I would like to enrich a time recording solution to be able to select a ticket from redmine. Therefore it would be great to have a REST API like the time entries with input variables for: • User • Date • Time • Project to retrieve all the tickets the user was working on this specific date. Time and project would be nice additional filter values. Regards, Vanessa	
journals At least this would reflect the informations that are presented in the "Activity" for a project.	
Duplicate of #14872.	
Please re-open this issue. #22109 proposes exposing the existing Redmine Activity view via an API. #14872 proposes introducing a new entity for lightweight notifications from systems external to Redmine. It proposes the name "Activities" which already has a meaning in Redmine context (any Redmine entity modified within a date range). These are not duplicates, but the confusing terminology on the latter ticket makes them appear so.	
Any update regarding this? Would like to fetch the activity of a user for a specific date. For instance; • "user 1 changed status of ticket #.... from 'new' to 'done'" - "user 1 assigned ticket #... to user 2"
