説明

My installation is intended to public. But people do not like to register. It is boring, it takes time, you need to remember zillions of passwords and it is not safe (databases are bing cracked). The solution was provided by openid first and its successor OAuth that is widely available. People can delegate authentication to OAuth providers like Google, Facebook, Twitter, LinkedIn and many others. It is very fast, convinient and reasonably secure.

Because you already have openid, the implementation will not be such difficult. The concept is the same. Thank you for consideration.

workaround

Use redmine_omniauth_google plugin for authenticate by Google ' s OAuth2 provider.
git clone https://github.com/twinklsh/redmine_omniauth_google
or forked branches.

journals**+ 1. It should be the built-in feature**

+1

This would be very convenient feature.

The following page got the feature, but not a public plugin yet.

<https://dev.keepassx.org/login>

Vote for this feature.

Thanks.

Since many companies use G Suite, providing "Login with Google" will be a great feature

+1
