説明

Modified the scan_themes method in themes.rb to allow themes to override responsive style sheet.

journals

NO, the proposed change does not do what you're describing here. This would require the presence of a responsive.css in each theme.

Themes are already able to override the responsive stylesheet, but your problme might be that they also have to override application.css (to be recognized as a theme), right?

My code works if the reponsive style sheet is present or not.

Before

After

I don't understand your previous note.

Sébastien,

What Jean-Philippe means is that with your proposed change applied, (existing) themes without an included responsive.css file won't be recognized by Redmine anymore.

You can try this yourself by deleting the responsive.css file of your custom theme. Subsequently your custom theme won't be recognized by Redmine any longer (because you've added another condition [which returns @false@ if a theme doesn't provide a responsive.css file] in the block that is passed to @select@).

I hope this clarifies the issue...

May I ask what the point of this would be? What are you trying to accomplish that's not otherwise feasible to do in your theme? Maybe we can find a better way...

Sébastien,

What Jean-Philippe means is that with your proposed change applied, (existing) themes without an included `responsive.css` file won't be recognized by Redmine anymore.

You can try this yourself by deleting the `responsive.css` file of your custom theme. Subsequently your custom theme won't be recognized by Redmine any longer (because you've added another condition [which returns `@false@` if a theme doesn't provide a `responsive.css` file] in the block that is passed to `@select@`).

I hope this clarifies the issue...

Now I understand the issue. I checked and I can only see the theme with the `responsive.css` in the list of available theme. So, what would be the best way to override the style of the `responsive.css`?

Right now, we can only override the `application.css` and not the `responsive.css` because the style sheet link is declared after the `application.css`.

In my case, I just want to change color of the menu and top bar.

A quick fix for you/for now would be to use a "more specific CSS selector": <https://css-tricks.com/specifics-on-css-specificity/> in your theme which can be easily achieved e.g. by adding `@body@` or `@#main@` in front of your selectors.

For a more generic solution we may want to look into moving the loading of `@responsive.css@` before the theme's css. (Including Felix as a watcher. Maybe he wants to chime in.)

Hi Sebastian,

Jan is correct about the way to override responsive theme styles. In the description of the ticket that provided the responsive patch you can find some examples #19097.

So in your case, just add this to your theme css:

```
/* Header background color */
#wrapper #header {
  background-color: #628db6;
}
```

if you only want to change the header background color on mobile, add the media query:

```
@media all and (max-width: 899px) {
  #wrapper #header {
    background-color: #628db6;
  }
}
```

I hope that helps.
