<b>説明</b>			
Hello,			
I actually work on a project where we are restructuring our Redmine workflow, before the bugtracker was a Mantis and Redmine was just used for features development. We are slowly depreciating Mantis to switch new bugs to Redmine.			
For now we have a parent project called "Bugtrack" accessible by our support and a sub-project called "Rip" where we are using some CSS to theme only these projects ( <a href="https://github.com/oklas/redmine-color-tasks">https://github.com/oklas/redmine-color-tasks</a> ) using the class in the body:			
The problem is that we will add in the future more subprojects and we will need to add manually new projects in the CSS, so my question is:			
Is it possible to get the class of the parent in a subproject like this:			
I think this feature (if she's not already known) can offer new possibilities of custom theme for particular projects
