説明

Right now we get per-user, per-role or totally public custom queries.

In our (and I'd guess in many other's) scenario we need to show (or hide) different queries to different projects (eg. belonging to different teams and/or with access granted to different customers) so the role-based control does not really fit in.

It would be super useful to be able to let a query "be owned by" a group instead of an user, so every one in the group could edit it and every one in the group can see it. More or less just like issues could be assigned to a group.

journals

Sorry for the typo, I meant "group based custom queries" for the title but I can't change that now

Fixed.

+1

To be more explicit: if I have 2 development teams that deal with different things but always have the same role (developer) and I have created a widget on the home-page in which I list all the custom queries, the 2 groups see each other's queries, even if there is no need for them. I should be able to specify the visibility of a custom query based on the group to which the user belongs. Currently, the only workaround is to duplicate the roles in order to show each of them only the queries of their own interest. But it's not a great solution.

Thanks in advance.
