説明 Currently custom field type List can be defined with set of values, and that set of values is used by +all projects+ that have that field enabled. I propose to define new custom field type, similar to List type that should have possibility to have +different set of values+ for +different projects+. Only with this functionality, issue #25043 brings great enhancement to serious multiproject environments. journals That would be great to have this type of custom fields. +1			
Is in near future planned this functionality? Maybe donation of some kind might prioritise this issue? Please evaluate this issue one more time. This issue is related to #5127 Do you have any plans to include this functionality to Redmine?			
related_issues relates,New,25043,Custom fields (type List): values inheritance, per project values
