

redmineorg-copy202205 - Vote #78461

Custom value from freshly disabled custom field in sub-project remains in issues list for parent project.

説明

Create a project hierarchy such as:

```
P1
|
P1.1
```

Create and Activate Issue Custom field @C1@ in Both projects.

Create an issue @I1@ in @P1.1@ with a value for field @C1@

Deactivate @C1@ in @P1.1@

Do not do any modification to @I1@

Go to @P1@ Issues view

Add @C1@ to selectedcolumns

Apply

Actual: Former value of @C1@ for @I1@ still shows

Expected: value of @C1@ for @I1@ shall be empty.

I know that if I save I1 after deactivating C1, the associated custom value for C1 will be erased, but the 'index' view should remain consistent with the 'show' view without having to manually perform a save.

I can confirm this behaviour as a valid defect on source: [trunk@16580](#). While I can see why that custom value isn't erased from the issue, it does causes some unexpected/undesired behaviours:

on P1's issue list with custom field column added: the custom value is displayed after the custom field is disabled in the P1.1 child project

on P1's issue list: filtering on the custom field won't match issue I1 (while I1 has a custom value set)

on P1.1's issue list: custom field column is not available anymore (making it impossible to retrieve I1's currently set custom value)

on P1.1's issue list: custom field filter is not available anymore (making it impossible to filter on 1's set custom value, if such filtering was already working correctly)

on I1's issue show: the set custom value (in fact the whole [inline] custom field column) is not displayed anywhere

So, either the custom values shall be deleted upon such a custom field deactivation or the filter/column should be kept available and filtering shall be made possible on these custom field values for these disabled custom fields.

What do others think about this?
