**説明**

Detected in version 3.4.2.

If I create a ticket with a tracker that has a custom field of type version (trying to realize "Affected version") I can assign all versions, regardless of their state. Now, I've got the same problem as it is described in #8572.

Project is a subproject. It has a list of versions that are not shared. The parent has also non-shared versions, which are correctly not listed.

As it seems the same problem exists on redmine.org in the @defect@ tracker as well.
