説明 In our Redmine, we have set a public project and have allowed certain permissions to the role "Non member". Hence, Users non members of the project can do certain actions. The moment we give a user a specific role in this project, he then loses all the rights of the "Non member" role. To me this is a bit counter intuitive. I would expect any role to at least take all the permissions of the "Non member" role. Right now for any role that could be used in this public project, we need to copy the permissions / adapt the workflows from the "Non member" role.
