説明

Here's some code from the @redmine_people@ plugin illustrating the problem:

```
<%= f.fields_for :information do |information| %>
  <p><%= information.text_field :middlename, :label => I(:label_people_middlename) %></p>
  <p><%= f.text_field :lastname, :required => true %></p>
```

Then one of the fields declares a label:

```
<p><%= information.select :gender, Person.get_genders, :label => I(:label_people_gender)%></p>
```

That generates this HTML:

```
<p><label for="person[information_attributes]_gender">Gender</label>
  <select name="person[information_attributes][gender]" id="person_information_attributes_gender">
    <option selected="selected" value="0">Male</option>
    <option value="1">Female</option>
  </select></p>
```

The @@ value has @[]@ in it instead of underscores @_@, so it does not match the target field's @id="person_information_attributes_gender"@. Clicking on the label does not put the keyboard focus into that @@ field.

The bug comes from this statement in LabelledFormBuilder:

```
@template.content_tag("label", text.html_safe,
  :class => (@object && @object.errors[field].present? ? "error"
  :for => (@object_name.to_s + "_" + field.to_s))
```

The @object_name@ has @[]@ in it, so something should replace them with "_".
