説明 The issue filtering is broken for all plugins that provides a custom queries implementation. Example... when a plugin creates new tab with customized issue filtering, it may implement new query class that inherits from IssueQuery. Unfortunately, the changes made for task #24787 in r16170 breaks this. This is because the <u>queries_controller</u> in the <u>def filter</u> is using <u>get_subclass</u> to figure out the actual query requesting values for the filter. The <u>get_subclass</u> is called on Query class and it uses <u>subclasses</u> to check if requested class is a Query. Unfortunately <u>subclasses</u> return only direct subclasses. This way, it is not possible now do customize any existing query class and all plugins that do so stopped working.
