説明

I'm attaching two proposals for the projects index page that can be achieved only with some CSS changes.

The single difference between the two proposals is how the subprojects are displayed.

1. Using the current method with left border, but applied for all subprojects, not only for the first children.

!{width:75%;border: 1px solid grey;}.projects_index_with_left_border.png!

1. Replaced the left border with the existing arrow used in other pages to display subprojects or subtasks.

!{width:75%;border: 1px solid grey;}.projects_index_with_arrow.png!

As I said also in the #26853, the current implementation is considered by many users a defect (7 issue reported since then) and is one of the most reported issue lately.

!{width:75%;border: 1px solid grey;}.projects_index_current.png!

Any feedback is welcome. I'll add the patch for review/testing very soon.

First of all I really like the idea of different views to navigate through projects in Redmine. I think that it can be very beneficial if you offer the user different viewing angles to fit their specific needs.

I find this particular design quite difficult as it mixes up two very different concepts of presentation. Tiles and trees. I think that it is not unusual behavior that people create logical, very nested structures like with folders on a file system. There are projects which represent different departments, customers, collections of projects, portfolios etc... I see a problems if many projects are collected under a single parent project which I think is very common. So if you have one or two projects which contain a few tens of projects, the view gets very ugly because you have most of your projects stuffed to the top of the page and single projects seem to drip to the bottom like wet paint.

What i would prefer the most is a tile based view of just one layer at a time where you can click through the subprojects like through folders in a file manager. It's a presentation I'm used to and it's easy for me to navigate. This in combination with a search bar would be the only view I ever need.

PS: If only these two options would be available I would tend to the version with arrows

but just because it looks prettier to me. And everything is better than the existing one!

I like the proposal of Marius BALTEANU (so I don't want to create another issue). The projects page sometimes looks ugly. In my case the project is displayed in one column but it's subproject - in other column (see attached screenshot).

We can achieve a better projects page only with some CSS changes. The most important change is to not allow to break inside a column.

The proposed solution has a down side effect on Safari (which is a known issue and I didn't find any solution to it).

!{width:60%; border: 1px solid black;}safari.png!

Tried to apply the patch, but doesn't seems to make sub-sub projects not break:

Did you restart your webserver or hard reset your cache?

Yes, you're right, there are cases when the view will be quite ugly, but I tried to find a better solution than the actual view until we discuss the implementation of #29482 (which will allow us to switch between two views: table list and a multi column list).

What i would prefer the most is a tile based view of just one layer at a time where you can click through the subprojects like through folders in a file manager. It's a presentation I'm used to and it's easy for me to navigate. This in combination with a search bar would be the only view I ever need.

Bernhard, nice idea, but it requires more changes.

Until we are getting there I'm totally fine with this solution as it's a thousand times better then the existing one.

I'm assigning this to version:"3.4.8" because I think that we should do something with the current projects page which is reported as defect by too many users (see #26853 and the related issues).

Jean-Philippe, until we implement #29482, I think the proposed patch improves the

current projects page. If you don't like the border around each root project, I think that at least the "break-inside: avoid-column;" rules are enough. What do you think?

Patch committed, thanks.
