説明 If the plugin directory name and the plugin id are not the same, the plugin will not work because the required files will not be read. Example: If you change the directory name of "redmine_vividtone_my_page_blocks plugin": https://github.com/vividtone/redmine_vividtone_my_page_blocks to redmine-vividtone-my-page-blocks, the following log will be output and it will not work well. Partial "my/blocks/new_issues" missing for block "new_issues" found in admin (id=1) preferences Partial "my/blocks/neglected_issues" missing for block "neglected_issues" found in admin (id=1) preferences Partial "my/blocks/doing_issues" missing for block "doing_issues" found in admin (id=1) preferences The problem is hard to solve because you can not notice that the wrong directory name is the cause of the problem. I think I should raise an exception if there is no directory with the same name as the plugin id. I attached a patch for that. journals I forgot to attach a patch :) Thank you for posting the patch. I think it would be even better if the exception has a more informative message like the following. With this message, an admin easily understands that he should rename the directory. Plugin not found. The plugin #{p.id} should be installed in #{p.directory}. I corrected the error message to include the directory name. +1 Nice work, quite helpful! Committed the patches. Thank you for your contribution. related_issues relates,New,31538,Allow a plugin to be installed in the directory different from the plugin id
