**説明**

I've created the following Wiki page with instruction about how to install and configure Sidekiq:

[SidekiqConfiguration](#)

Please let me know what do you think and where we should link the page.

journals

Hi Marius, I read the wiki and it is really well documented. Thanks!

Very cool! Thank you for sharing this. I'll can't wait to give it a try. :-)

I think this is a good [howto](#) for setting up these components. I suggest to categorize and link it as such.

Maybe beyond the intended scope of this issue, but I think we also need some short mentions under `[[RedmineInstall#Optional-components|RedmineInstall#Optional-components]]` and `[[RedmineInstall#Optional-dependencies|RedmineInstall#Optional-dependencies]]`, and a short description under `[[RedmineInstall#Configuration|RedmineInstall#Configuration]]` with a link to a separate wiki page which should contain a (more) generic, more detailed description of (the handling of) background jobs in Redmine specific (e.g. what is handled by background jobs [also thinking about proposed #31076 here]) and Rails in general (how does Redmine relate to Rails in this area [via ActiveMailer, ActiveJob, Queues/QueueAdapters, 3rd-party queuing backends]). This should not be tied specifically to persistent, 3rd-party queuing backends, also the default in-process queuing implementation needs some coverage (see e.g. #31939, #31957). Additionally, some info for plugin developers would be nice too.

**SPAM Message (Bernhard Rohloff)**

Is it possible to solve it under Windows-server? My configuration of Redmine:

Environment:

Redmine version 4.1.1.stable

Ruby version 2.6.6-p146 (2020-03-31) [x64-mingw32]

Rails version 5.2.4.2

Environment production

Database adapter MySQL2

Mailer queue ActiveJob::QueueAdapters::AsyncAdapter

**Mailer delivery smtp**

Database adapter Mysql2

Mailer queue ActiveJob::QueueAdapters::AsyncAdapter

Mailer delivery smtp

My problem was different. It was in connector on SMTP server, where was set low limit emails per minute from IP address. So simple! It works with Async and SuckerPunch. So I think it will work with Sidekiq too.
