**説明**

In sophisticated position a repository may contain revision without message.

journals

I'm not familiar with Mercurial, so I don't understand the improvements the patch brings. Could you explain the benefits?

Mercurial is very similar to git. I added another source to my repository, and when did pull from that source, unbelievably there is a revision without any commit message. When I wanted to fetch changesets, there was an exception (line that patched).

Thank you, I understand the situation.

Can you please paste the error message in production.log ?

App 2260378 output: lib/redmine/sudo_mode.rb:61:in `sudo_mode'
```

I have confirmed this issue. Applying the patch(attachment:empty\_message.diff) solved it. thank you.

I created @MercurialAdapterTest#test\_empty\_message@ because there was no test.
